

Instructions for the Miracle-Gro garden hose feeder application of Nemasys and Nemaslug

These instructions are applicable to all pack sizes up to 100m² in the Nemasys Home & Garden range (excl Nemasys Vine Weevil Killer 12m² pack and Nemasys Caterpillar and Codling Moth Killer). However, please note the different application timings in point 4. when applying to lawns.

- Wash the feeder through with water to ensure it is clean.
- Add entire contents of the pack to the bowl of the feeder. Then fill the bowl with water and stir to mix thoroughly. Attach the hose.
- Taking care to keep the feeder in an upright position, apply evenly to the whole of the area for a timed period, using a side-to-side motion to keep the nematodes well mixed. During this time most of the nematodes will have been applied.
 - Variable spray Miracle-Gro Feeder with spray **set to 'flat'** – for 5 minutes
 - Fixed spray Miracle-Gro Feeder – for 8 minutes
- Treat the same area again for a further 8 minutes (or 16 minutes for lawn applications) to apply the remaining nematodes as well as to make sure they are adequately watered in. Applications to lawns require more water to ensure the nematodes are washed through the grass thatch.
- Adhering strictly to the application timings will ensure that any remaining colour in the bowl will be due to inert carrier only and that you have performed an even application.
- This new method provides a simple and effective application, however, it is important to follow the instructions exactly to obtain even coverage.
- Only the **Miracle-Gro[®] Feeder** feeder is recommended for use with this method;

Miracle-Gro is a registered trademark of The Scotts Company
Nemasys and Nemaslug are registered trademarks of Becker Underwood

NB: When applying to pots it is still better to use the watering can method as it would be difficult to judge the area and timing.

Instructions for Superspray garden hose feeder application of Nemaslug

These instructions only apply to Nemaslug 40m² and 100m² in the Nemasys Home & Garden range.

- Wash the feeder through with water to ensure it is clean.
- Add half the contents of the 40m² pack or a quarter of the 100m² pack to the bowl of the feeder. Then fill the bowl with water and stir to mix thoroughly. Attach the hose.
- Apply evenly to the area to be treated using a side-to-side motion to keep the nematodes well mixed. This should take about 5 minutes, depending upon water pressure.
- Repeat these steps on the other areas of ground to be treated using the remaining portions of the Nemaslug pack
- Treat the same area again for a further 10 minutes (or 16 minutes for lawn applications) to make sure they are adequately watered in. Applications to lawns require more water to ensure the nematodes are washed through the grass thatch.
- This method provides a simple and effective application, however, it is important to follow the instructions exactly to ensure the nematodes reach the pests.
